Solution

- (a) let y be the amount of bacteria present at time, t . The rate of change of y with time is proportional to the amount of bacteria present at time t i.e. y

$$\frac{dy}{dt} \propto y \Rightarrow \frac{dy}{dt} = ky$$

where k is a constant

$$\frac{dy}{y} = k dt$$

$$\int \frac{1}{y} dt = k \int dt$$

$$\ln y = kt + c$$

$$\Rightarrow e^{\ln y} = e^{kt+c}$$

$$y = e^{kt} \cdot e^c$$

$$\text{let } e^c = b$$

$$y = be^{kt}$$

Initial amount of bacteria i.e. $y(0) = 20$

$$\Rightarrow 20 = be^{k \cdot 0}$$

$$b = 20$$

$$y = 20e^{kt}$$

(b) $1\frac{1}{2}$ days = 36 hours
half life = 5 hours

when $t=1t$, the bacteria is twice its original number

$$be^{Kt} = be^{Kt} = 2 \cdot y$$

$$20e^{5K} = 2 \cdot 20$$

$$20e^{5K} = 40 \Rightarrow e^{5K} = \frac{40}{20} = 2$$

$$K = \frac{\ln 2}{5}$$

$$K = 0.1386$$

$$y = 20e^{0.1386 \times 36}$$

$$y = 2937.5$$

$$y \approx 2938$$

(d) at $t = 0$, $y = b$

$$y(0) = 10$$

$$10 = be^{K \cdot 0}$$

$$b = 10$$

$$\Rightarrow y = 10e^{Kt}$$

$$10 \cdot e^{KH} = 20$$

$$e^{KH} = \frac{20}{10} = 2$$

$$K = \frac{\ln 2}{5}$$

$$K = 0.1386$$

$$y = 10e^{0.1386t}$$

$$\text{at } y = 10e^{0.1386 \times 36}$$

$$y = 1468.7$$

$$y \approx 1469$$

$$\text{at } t = 0, y = b$$

$$y(0) = 30$$

$$30 = b e^{k \cdot 0}$$

$$b = 30$$

$$\Rightarrow y = 30 e^{kt}$$

$$30 e^{kH} = 60$$

$$e^{kH} = \frac{60}{30}$$

$$= 2$$

$$k = \frac{\ln 2}{5}$$

$$= 0.1386$$

$$y = 30 e^{0.1386 t}$$

$$\text{at } t = 36 \text{ hours}$$

$$y = 30 e^{0.1386 \times 36}$$

$$y = 4406$$

$$y(0) = 50$$

$$50 = b e^{k \cdot 0}$$

$$b = 50$$

$$\Rightarrow y = 50 e^{kt}$$

$$50 e^{kH} = 100$$

$$e^{kH} = \frac{100}{50} = 2$$

$$k = \frac{\ln 2}{5}$$

$$= 0.1386$$

$$\Rightarrow y = 50 e^{0.1386 t}$$

$$y = 50 e^{0.1386 \times 36}$$

$$y = 7343.8$$
$$y \approx 7344$$

From the graph obtained in step d, it is shown that the amount of bacteria varies linearly with time i.e. an increase in time leads to an exponential growth of bacteria.
