

Metric no : 191mms09 / 1002

Ques 002

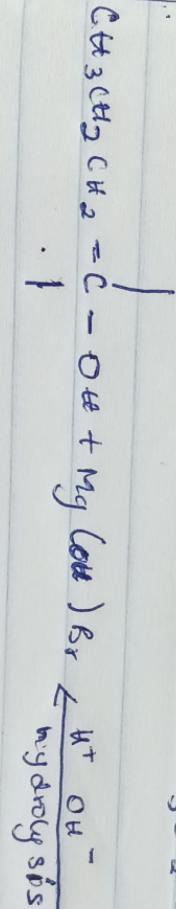

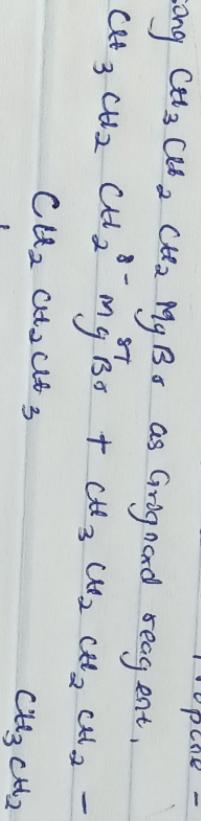

(1) Based on the number of hydrogen atoms attached to the carbon atom containing the hydroxyl group: If the numbers of hydrogen atoms attached to the carbon atom belongs to the carbon atom bearing the hydroxyl group are three or two, it is called a primary alcohol. If it's one hydrogen atom, it is called secondary alcohol and if no hydrogen atom is attached to the carbon bearing the hydroxyl group, it is called a tertiary alcohol.

Examples: 1) CH_3OH Methanol (1)

(2) Based on the number of hydroxyl groups they possess. Monohydric alcohols also called glycols, having two hydroxyl groups present in the alcohol structure. Dihydric alcohols are those which have three hydroxyl groups present in the structure of the alcohol. Polyhydric alcohols or polyols have more than three hydroxyl groups.

Examples: $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$ Propanol (monohydric alcohol)

Ques 003 $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH} + \text{HgBr} \rightarrow \text{Propane}-1,2,3-\text{triol}$ (trihydric alcohol)

Ques 004

(2)

Carbohydrates such as starch can be made to yield ethanol by the process of fermentation.

The enzymes in yeast, break down starch to yield 45%. The starch containing both maltose to 60°C are converted into maltose by diastase. $2(\text{C}_6\text{H}_{10}\text{O}_5)_n + n\text{H}_2\text{O} \xrightarrow{\text{Diastase}} \text{C}_6\text{H}_{12}\text{O}_6$. The maltose is broken down into glucose on addition of yeast which converts maltose at 15°C

$\text{C}_6\text{H}_{12}\text{O}_6 + \text{H}_2\text{O} \xrightarrow{15^\circ\text{C}/\text{Maltase}} 2 \text{C}_6\text{H}_{12}\text{O}_6$ glucose

The glucose at constant temperature of 15°C is converted to alcohol by zymase also

$\text{C}_6\text{H}_{12}\text{O}_6 \xrightarrow{15^\circ\text{C}/\text{Zymase}} 2 \text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$

$\text{HCHO} \xrightarrow{\text{H}_2\text{Pt or Pt/C}} \text{CH}_3\text{OH}$

$\text{HCHO} \xrightarrow[20^\circ\text{C}]{\text{Pt/C}} \text{CH}_3\text{OH}$

$\text{C}_2\text{H}_5\text{CH}_2\text{C}=\text{O} \xrightarrow{\text{ZnCl}_2/\text{Et}_2\text{O}} \text{C}_2\text{H}_5\text{CH}_2\text{COOC}_2\text{H}_5$

$\text{C}_2\text{H}_5\text{CH}_2\text{C}=\text{O} \xrightarrow{\text{H}_2\text{CrO}_4 \text{ or } \text{Pb(OAc)}_4} \text{C}_2\text{H}_5\text{CH}_2\text{CO}_2\text{H}$
