Semester 102.

### Assignment

i. Primary Alkanol: In a primary alcohol, the hydroxyl group is attached to a primary (terminal) carbon atom in the molecule, it is characterized by  $-CH_2OH$ .

Example:

i.  $CH_3OH$  Methanol

ii.  $CH_3CH_2OH$  Ethanol

b. Secondary Alkanol: In a secondary alcohol the  $OH$  group is on a secondary carbon atom, characterized by  $>CH(OH)CH_2$ .

Example:

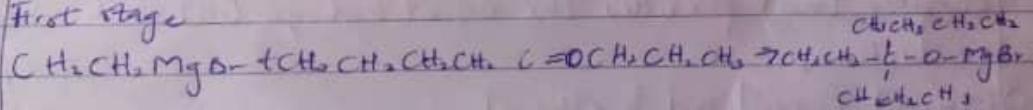

i.  $CH_3CH(OH)CH_3$  Propan-2-ol

ii.  $(CH_3)_2C-OH$  2-Methylpropan-2-ol

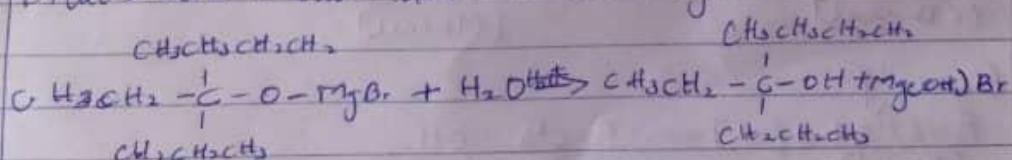

2. In the Grignard synthesis of Alcohols, react a named Grignard reagent with

$CH_3CH_2CH_2CH_2C=OCH_3$   $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{C}(=\text{O})\text{OCH}_3$  Show the reaction steps.

First stage

Dilute acid is then added to this to hydrolyze it

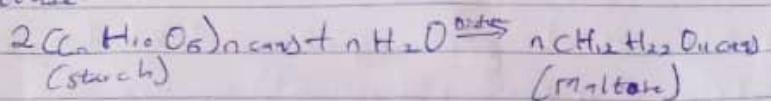

An alcohol is formed. The key use of Grignard reagent is the ability to make complicated alcohols easily.

3) Industrial preparation of ethanol

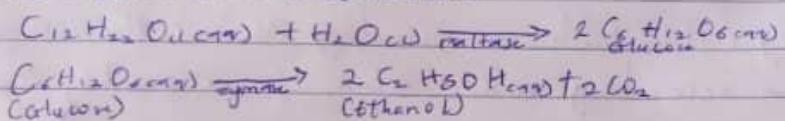

a) The starch containing crop, such as cassava is peeled crushed and steam-heated or pressure-cooked to release with water to

obtain a marsh.

b) The marsh is treated with malt yeast, and warmed at 50°C for two hours. Enzyme diastase in the malt hydrolyses starch to maltose.

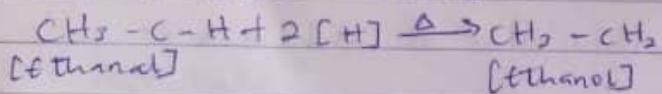

c) Yeast containing enzymes maltose and zymase is added to mixture and kept at room temperature (about 27°C) for fermenting glucose to ethanol with the evolution of carbon dioxide. The reaction is exothermic.

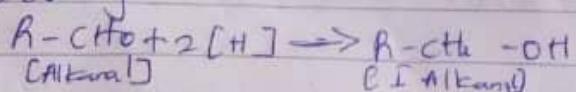

The mixture is distilled to obtain 95% ethanol that boils at 78°C.

4. Products obtained in the reduction of Alkanone and Alkenal. Alkanals are reduced to the corresponding primary alcohols by reducing agents such as lithium tetrahydraluminate (LiAlH<sub>4</sub>) that provides the nascent hydrogen (H<sup>+</sup>), which causes reduction;

a) Ethanal is reduced to ethanol

b) Generally

This reaction shows that alkanals are oxidizing agents. Alkanones are reduced to the corresponding secondary alkanols. LiAlH<sub>4</sub> reduced propanone  $CH_3-C(=O)-CH_3 + 2[H]$

$CH_3-C(=O)-CH_3$  to Propan-2-ol. The reducing agent provides the nascent hydrogen atom as [H].
