a Primary alcohol: In a primary alcohol, the hydroxyl group is attached to primary (terminal) carbon atom in the molecule. It is characterised by $\text{---CH}_2\text{OH}$.

Example

i CH_3OH Methanol

ii $\text{CH}_3\text{CH}_2\text{OH}$ Ethanol

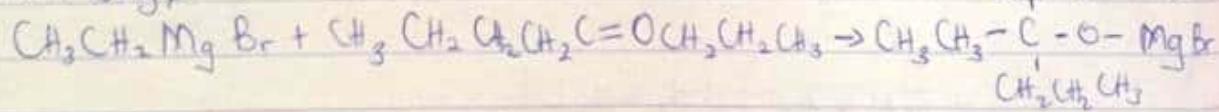

b Secondary alcohol: In a secondary alcohol, the ---OH group is on a secondary carbon atom; Characterised by ---CH(OH)---CH_2 .

Example

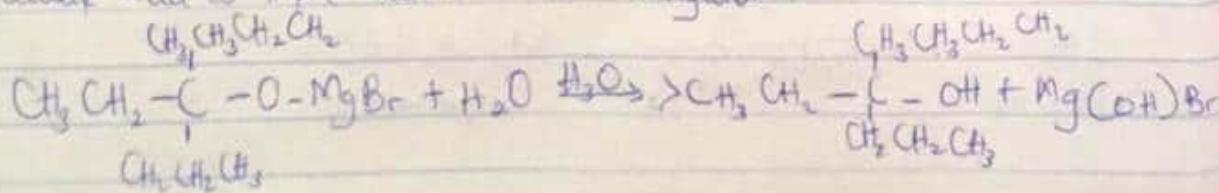

i $\text{CH}_3\text{CH}(\text{OH})\text{CH}_3$ Propan-2-ol

ii $(\text{CH}_3)\text{C---CH}_2\text{OH}$ 2-Methylpropan-2-ol

2 In the Grignard synthesis of alcohols, react a named Grignard reagent with $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{C=OCH}_2\text{CH}_2\text{CH}_3$. Show the reaction steps.
First stage:

Dilute acid is then added to this to hydrolyse it.

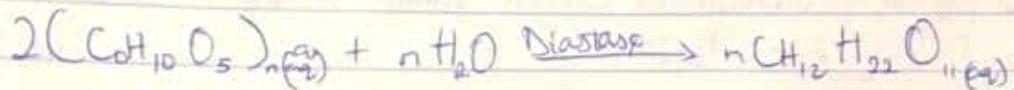

An alcohol is formed. The key use of Grignard reagent is their ability to make complicated alcohols easily.

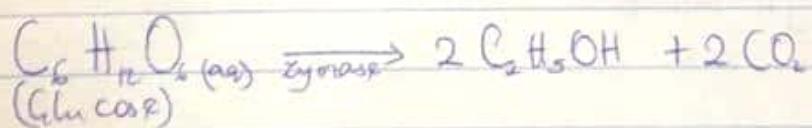

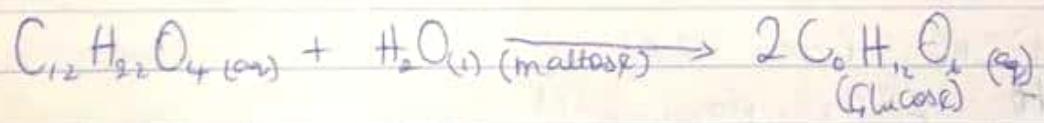

3 Industrial Preparation of Ethanol

9 The starch containing crop, such as cassava is peeled, crushed and heated or pressure cooked to release starch with water to obtain a mash.

6 The mash is treated with malt yeast, and warmed at 50°C for two hours. Enzyme diastase in the malt hydrolyses starch for maltose.

C Yeast containing enzymes maltase and ~~symase~~ Symase added to mixture and kept at room temperature (about 27°C) for about three days. During this period, enzyme Symase converts glucose to ethanol with the evolution of carbon dioxide. The reaction is exothermic.

The mixture is distilled, to obtain 95% ethanol that boils at 78°C .

4 Reduction of Carbonyl Compounds
