Matric no: 19 (MTH/1140)  
DEPT: Pharmacy  
Course: CHM 102

- 1) a)  $\text{CH}_3\text{OCH}_3 \rightarrow$  Methoxymethane  
b)  $\text{CH}_3\text{CH}_2\text{OCH}_2\text{CH}_3 \rightarrow$  Ethoxyethane  
c)  $(\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2)_2\text{O} \rightarrow$  Butoxymethane  
d)  $\text{CH}_3\text{CH}_2\text{OCH}_3 \rightarrow$  Methoxyethane  
e)  $\text{CH}_3\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_3 \rightarrow$  Ethoxypropane

2) Physical states: At room temperature, ethers are colourless neutral liquid with pleasant odours. The lower aliphatic ethers are highly flammable gases or volatile liquids.

2) Solubility: Ethers are less soluble in water than are the corresponding alcohols. Lower molecular weight ethers such as methoxymethane and methoxyethane are fairly soluble in water since the molecules are able to form hydrogen bonds with the water molecules but as the hydrocarbon content of the molecules increases, there is a rapid decline in solubility. They are miscible with most organic solvents.

iii) Density: Most of the simple ethers are less dense than water although the density increases with increasing relative molecular mass and some of the aromatic ethers are in fact denser than water.

iv) Boiling Point: Low molecular mass ethers have a lower boiling point than the corresponding alcohols but those ethers containing alkyl radicals larger than four carbon atoms, the reverse is true. The boiling point of ethers tend to approximate those of hydrocarbons of same relative molecular mass from which it can be concluded that the molecules are ~~most~~ <sup>not</sup> associated in the liquid phase as

there are no suitably available hydrogen for association through hydrogen bonds.

v) Reactivity: Ethers are inert at moderate temperature. Their inertness at moderate temperature leads to their wide use as reaction media. Simple ethers are not found commonly in nature but the ether linkage is present in such natural products as sugars, starches and cellulose.

3) a) Controlled catalytic hydration of olefins [alkene]

Through controlled catalytic hydration of olefins we get ethers

b) From haloalkanes and dry silver (I) oxide: Through haloalkanes and dry silver (I) oxide we get ethers

4) Uses of ethylene oxide

- 1) Ethylene oxide is used as an intermediate in the hydrolytic manufacture of ethylene glycol
- 2) Ethylene oxide is used in preparation of nonionic emulsifying agents, plastics, plasticizers and several synthetic textiles
- 3) Ethylene oxide is used as a gaseous sterilizing agent.
