 Course: Mat 101
 Dept: Mechanical
 College: Engineering
 Matrices: 17/01/2015/2014

Integrate the following with respect to the
 indicated variable.
Solution:

① $3te^{2t} = \int 3te^{2t} dt$
 $3 \int te^{2t} dt$

Recall $\int u dv = uv - \int v du$

where $u = t$; $e^{2t} = v$; $\frac{du}{dt} = 1$; $dv = 2e^{2t}$
 $v = \frac{1}{2} e^{2t}$

Substitute into the equation:

$= t \cdot \frac{1}{2} e^{2t} - \int \frac{1}{2} e^{2t} \cdot dt$

$= \frac{1}{2} t e^{2t} - \frac{1}{2} \int e^{2t} dt$

$= \frac{1}{2} t e^{2t} - \frac{1}{4} e^{2t} + C$

$3 \left(\frac{1}{2} t e^{2t} - \frac{1}{4} e^{2t} + C \right) = \frac{3}{2} t e^{2t} - \frac{3}{4} e^{2t} + C$

2 $x^2 \sin x$

Solution

$\int x^2 \sin x dx = uv - \int v du$ where $u = x^2$; $dv = \sin x$

$du = 2x dx$; $v = -\cos x$

$= -x^2 \cos x - \int -\cos x \cdot 2x dx$

$= -x^2 \cos x - \int -2x \cos x dx$

$= -x^2 \cos x + 2 \sin x - \int 2 \sin x dx$

$= -x^2 \cos x + 2x \sin x - (2 \cos x)$

$= -x^2 \cos x + 2x \sin x + 2 \cos x + C$

③ $\sin 7x \cos 2x$

Solution:

$\int \sin 7x \cos 2x$

Recall

$\sin a \cdot \cos b = \frac{1}{2} (\sin(a+b) + \sin(a-b))$

$$\begin{aligned} \sin(3x) \cos(2x) &= \frac{1}{2} (\sin 5x + \sin x) \\ &= \frac{1}{2} \int \sin 5x dx + \frac{1}{2} \int \sin x dx \\ &= \frac{1}{2} \left(\frac{-\cos(5x)}{5} \right) + \frac{1}{2} \left(\frac{-\cos(x)}{1} \right) + C \\ &= \frac{-\cos(5x)}{10} - \frac{\cos(x)}{2} + C \end{aligned}$$

4. $\frac{(2x-3x^2)}{1-x}$

solution

$$\int \frac{2x-3x^2}{1-x} dx \quad \text{let } u = 2x-3x^2$$

$$du = 2-6x dx$$

$$dx = \frac{du}{2-6x}$$

$$\int \frac{u}{1-x} \cdot \frac{du}{2-6x}$$

$$\int \frac{u}{(1-x)(2-6x)} du = \int \frac{A}{(1-x)} + \frac{B}{(2-6x)}$$

Multiply through by $(1-x)(2-6x)$

$$2x-3x^2 = (2-6x)A + B(1-x)$$

When $x=1$ when $x=1/3$

$$-1 = -4A \quad 4/3 = 7/3 B$$

$$A = 1/4 \quad B = 4/7$$

$$\int \frac{1}{4} (1-x) + \int \frac{4}{7} (2-6x)$$

$$= \frac{1}{4} (x) + \frac{8}{7} (x) + C$$

$$= -2x - x + C$$

$$= -3x + C$$
