$$y_0 := 10$$

at 5 min, temp =20 degrees
actual temp=25
taking average temp:(20+25)/2=22.5

using decay equation +
 $y = y_0 \cdot \exp(k \cdot t)$
if $y = 22.5, y_0 = 10, t = 5$
solving: $k = 0.162$

rewriting equation to find k

$$t := \left(\frac{\ln\left(\frac{22.5}{10}\right)}{0.162} \right)$$

$$t = 5.006$$
