NAME: OJO-ONI DANIEL OLUWASEGUN, MAT102, GENERAL MATH II  
DEPT. AERONAUTICAL ENGINEERING, MATRIC NO: 19/ENG09/016.  
DATE SUBMITTED: 5TH OF MAY, 2020. ASSIGNMENT FOR MR. OKUNLOLA  
Find the point of the intersection of the following lines on the  
Circle.

$$1) x - y - 14 = 0 \text{ and } x^2 + y^2 - 6x + 8y = 0.$$

Solution:

The equation of the Circle is given by  $x^2 + y^2 - 6x + 8y = 0$

$$x^2 - 6x + y^2 + 8y = 0 \text{ re-writing this}$$

$$(x - 3)^2 - 9 + (y + 4)^2 - 16 = 0. \text{ Collecting like terms}$$

$$(x - 3)^2 + (y + 4)^2 - 25 = 0.$$

$$(x - 3)^2 + (y + 4)^2 = 25.$$

$$(x - 3)^2 + (y + 4)^2 = 25. \quad \text{--- (i)}$$

$$\therefore \text{Centre} = (3, -4), \text{ radius} = \sqrt{25} = 5.$$

Linear equation,  $x - y - 14 = 0$ , make  $y$  the subject  
of the formulae,  $y = x - 14$ . --- (ii), substitute (ii) into (i)

$$(x - 3)^2 + (y + 4)^2 = 25$$

$$(x - 3)^2 + (x - 14 + 4)^2 = 25$$

$$x(x - 3) - 3(x - 3) + (x - 10)^2 = 25$$

$$x^2 - 3x - 3x + 9 + (x - 10)^2 = 25$$

$$x^2 - 6x + 9 + x^2 - 20x + 100 = 25$$

$$2x^2 - 26x + 84 = 0. \quad \text{--- factorizing.}$$

$$(2x^2 - 14x) - 12x + 84 = 0$$

$$2x(x - 7) - 12(x - 7) = 0$$

$$(2x - 12)(x - 7) = 0$$

$$2x - 12 = 0 \text{ or } x = 7.$$

$$x = 6 \text{ or } x = 7.$$

Substitute the values for  $x$  into the linear equation to  
get the corresponding values for  $y$ : i.e.  $(x, y)$  coordinates.

$$\text{for } x = 6, \quad y = x - 14 = 6 - 14 = -8 \quad \text{--- A (6, -8)}$$

$$\text{for } x = 7, \quad y = 7 - 14 = -7 \quad \text{--- B (7, -7)}$$

**NAME: OJO-ONI DANIEL OLUWASEGUN, MATRIC NO.; 19/ENG09/016,  
DEPARTMENT; AERONAUTICAL ENGINEERING, COURSE, MAT 102  
GENERAL MATHEMATICS II, LECTURER; MR. OKUNLOLA**

$A(6, -8), B(7, -7)$  are the points of intersection  
 b)  $2x + y - 10 = 0$  and  $x^2 + y^2 + 4x - 6y = 0$ .

Solve  
 Given  $x^2 + y^2 + 4x - 6y = 0$  re-arranging  
 $x^2 + 4x + y^2 - 6y = 0$   
 $(x+2)^2 - 4 + (y-3)^2 - 9 = 0$  Collect like terms  
 $(x+2)^2 + (y-3)^2 - 13 = 0$ ;  $(x+2)^2 + (y-3)^2 = 13$  ... (i)

Centre =  $(-2, 3)$  and radius =  $\sqrt{13}$   
 linear equation =  $2x + y - 10 = 0$  ... (ii)  
 $y = 10 - 2x$  ... (iii) Substitute (iii) into (i)

From (i),  $(x+2)^2 + (y-3)^2 = 13$   
 $(x+2)^2 + (10-2x-3)^2 = 13$   
 $x^2 + 4x + 4 + (7-2x)^2 = 13$   
 $x^2 + 4x + 4 + (7(7-2x) - 2x(7-2x)) = 13$   
 Simplifying,  $x^2 + 4x + 4 + (49 - 14x - 14x + 4x^2) = 13$   
 $x^2 + 4x + 4 + (49 - 28x + 4x^2) = 13$   
 $5x^2 - 24x + 40 = 0$

when we solve this, the value of  $x$  gives an  
 imaginary number i.e.  $x = \frac{12}{5} + \frac{2\sqrt{14}}{5}i$

This makes it quite impossible  
 to find the points of the circle and the line.

c)  $x^2 - 5y - 2 = 0$  and  $x^2 + 25y^2 - 62y - 16 = 0$   
 solve.  
 Given  $x^2 + 25y^2 - 62y - 16 = 0$  to be the equation,  
 $x^2 + y(25y - 62) - 16 = 0$  ... (i)

Given  $x^2 - 5y - 2 = 0$   
 $x = 5y - 2$  ... (ii) substituting,  
 $(5y-2)^2 + y(25y - 6(5y-2)) - 16 = 0$  expanding,  
 $25y^2 - 20y + 4 + y(25y - 30y + 12) - 16 = 0$   
 $25y^2 - 20y + 25y^2 - 30y^2 + 12y - 16 = 0$   
 $20y^2 - 8y - 12 = 0$  solving quadratically.

**NAME: OJO-ONI DANIEL OLUWASEGUN, MATRIC NO.; 19/ENG09/016,  
DEPARTMENT; AERONAUTICAL ENGINEERING, COURSE, MAT 102  
GENERAL MATHEMATICS II, LECTURER; MR. OKUNLOLA**

$(20y - 20) + 12y - 12 = 0$   
 $20y(y-1) + 12(y-1) = 0$   
 $(20y + 12)(y-1) = 0$   
 $20y + 12 = 0$  or  $y = 1$   
 $\frac{20y}{20} = \frac{-12}{20}$  or  $y = 1$   
 $y = -3/5$  or  $y = 1$   
∴ using the values above to find the points of intersection.  
when  $y = -3/5$ , from (i),  $x = 5y - 2 = 5\left(\frac{-3}{5}\right) - 2 = -5$   
∴ Point A =  $(-5, -3/5)$   
when  $y = 1$ , from (i),  $x = 5y - 2 = 5(1) - 2 = 3$   
∴ Point B =  $(5, 1)$   
∴ The points will be A  $(-5, -3/5)$  and B  $(5, 1)$ .
