1 Applying balance law

$$\text{Accumulation rate} = \text{input rate of salt} - \text{output rate of salt}$$

its time rate of change ^{is give} as,

$$\frac{dy}{dt} = y_{in} - y_{out}$$

Since 50 gal of brine enter the tank per minute and one gallon contains $(1 + 5t)$ lb of salt
 When $t = 1$, $(1 + 5(1)) = (1 + 5(1)) = 1.02$ lb of salt
 \therefore A means that amount of salt entering a tank is;

$$y_{in} = \frac{50 \text{ gal}}{\text{min}} \times \frac{1.02 \text{ lb}}{\text{gal}} = \frac{51 \text{ lb}}{\text{min}}$$

The tank contains 1200 gal of water with 10 lb dissolved salt. 30 gallons of solution the tank per minute. That is $\frac{30 \text{ gal}}{1200 \text{ gal}} = 0.025$

= 2.5% of the content of the tank. If that case 2.5% of the salt present in tank will also leave the tank per minute in other word

$$y_{out} = 2.5\% \text{ of } y$$

a Therefore:

$$\frac{dy}{dt} \frac{\text{lb}}{\text{min}} = \frac{51 \text{ lb}}{\text{min}} - 2.5\% \text{ of } y \frac{\text{lb}}{\text{min}}$$

$$\frac{dy}{dt} = 51 - 0.025y, \quad \frac{dy}{dt} = -0.025y + 51$$

$$\frac{dy}{dt} = -0.025 \left[\frac{-0.025y + 51}{-0.025y - 0.025} \right] \cdot \frac{dy}{dt} = -0.025(y - 2040)$$

$$\frac{dy}{(y - 2040)} = -0.025 dt; \quad \int \frac{dy}{(y - 2040)} = \int -0.025 dt$$

$$\int \frac{dy}{(y - 2040)} = -0.025 \int dt; \quad \ln(y - 2040) = -0.025t + C,$$

$$y - 2040 = e^{-0.025t + C}; \quad y - 2040 = e^{-0.025t} e^C;$$

$$y - 2040 = e^{-0.025t} y_0; \quad y - 2040 = y_0 e^{-0.025t};$$

$$y = y_0 e^{-0.025t} + 2040, \text{ given that when } t = 0$$

$$\text{Initially}; \quad y = 150 \text{ lb}$$

$$150 = y_0 e^{0.025(0)} + 2040, \quad 150 - 2040 = y_0 \times 1,$$

$$y_0 = 1890$$

Then

$$y = -1890e^{-0.025t} + 2040$$

$$y = 2040 - 1890e^{-0.025t}$$
