Question 1

Tank holds 1200 gal of water with 150 lb of salt dissolved in it

- input rate \Rightarrow 50 gal of brine/min [1 gal has $(1 + \sin t)$ lb of salt]

- Output rate \Rightarrow 30 gal of brine/min
 $m \Rightarrow$ Amount of salt at anytime
Using the balance law
 $\frac{dm}{dt} = m_{in} - m_{out}$

1) 50 gal of water per minute and a gallon has $(1 + \sin t)$ lb of salt
 $m_{in} = 50 \text{ gal/min} \times (1 + \sin t) = 50(1 + \sin t) \text{ lb/min}$
if the tank contains 1200 gal of water and 30 gal of water leaves per minute. That is $\frac{30}{1200} = \frac{1}{40} = 0.025$

\Rightarrow 2.5% of water in the tank leaves per minute. This also means that 2.5% of salt will also leave the tank per minute

$m_{out} \Rightarrow 2.5\% \text{ of } m$

$$\frac{dm}{dt} = 50(1 + \sin t) - 0.025m \quad \dots \dots (i)$$

differentiating using integration factor method
 $\frac{dm}{dt} + 0.025m = 50(\sin t + 1) \quad \dots \dots (ii)$

$$\frac{dy}{dx} + P_y = Q \quad \left(\frac{dm}{dt} + P_m = Q \right)$$

$$P = 0.025, \quad Q = 50(\sin t + 1)$$

$e^{\int P dt} =$ integrating factor

$$\int P dt = \int 0.025 dt = 0.025t$$

$$I_f \Rightarrow e^{0.025t}$$

from $y \cdot IF = \int Q \cdot IF dx$

$m \cdot IF = \int Q \cdot IF dt$
 $m \cdot e^{0.025t} = \int 50(\sin t + 1) \cdot e^{0.025t} dt$

$= 50 \int e^{t/40} (\sin t + 1) dt$

Let $u = \frac{t}{40} \rightarrow \frac{du}{dt} = \frac{1}{40}, dt = 40 du$

$= 40 \int e^u (\sin 40u + 1) du$

$\int e^u (\sin 40u + 1) du$

Let $q = \sin 40u + 1, dp = e^u du$
 $\frac{dq}{du} = 40 \cos 40u, \int dp = \int e^u du$
 $p = e^u$

$dq = 40(\cos 40u) du$

From $\int q dp = qp - \int p dq$

$\int 40e^u (\cos 40u) du \Rightarrow 40 \int e^u (\cos 40u) du$

$\int e^u \cos 40u du \Rightarrow$ Let $q = \cos 40u, dp = e^u du$

Integrating

$\int e^u \cos 40u du = e^u \cos 40u - \int -40e^u (\sin 40u) du \rightarrow (iii)$

integration by part

$q = -40 \sin 40u, dp = e^u$
 $dq = -1600(\cos 40u) du, p = -e^u$

$\int e^u \cos 40u du = e^u \cos 40u - (-40e^u \sin 40u - \int -1600e^u \cos 40u du)$

$1600 \int e^u \cos 40u du = e^u \cos 40u + 40e^u \sin 40u$

$\int e^u \cos 40u du = \frac{e^u \cos 40u + 40e^u \sin 40u}{1600}$

$40 \int e^u \cos 40u du = 40(40e^u \sin 40u + e^u \cos 40u) \rightarrow (iv)$

From (iii)

$\Rightarrow \int e^u (\sin 40u + 1) du = e^u \sin 40u + 1 - \int 40e^u \cos 40u du$

$\int e^u (\sin 40u + 1) \Rightarrow e^u \sin 40u + 1 - \frac{40(40e^u \sin 40u + e^u \cos 40u)}{1600}$

$$40e^v \sin 40v + 1dv = 40e^v (\sin 40v + 1) - \frac{1600 (40e^v \sin 40v + e^v \cos 40v)}{1601}$$

put $u = t/40$

$$40e^{t/40} (\sin t + 1) - \frac{1600 (40e^{t/40} + e^{t/40} \cos t)}{1601}$$

$$\int 40e^{t/40} (\sin t + 1) dt \Rightarrow \frac{2000e^{t/40} (\sin t - 40 \cos t + 1601)}{1601} + C \quad \text{--- (v)}$$

Recall the original integration factor

$$m \cdot I_f = \int Q \cdot I_f dt$$

$$m \cdot e^{0.025t} = \int 150 (\sin t + 1) \cdot e^{0.025t} dt$$

put eqn (v)

$$m \cdot e^{0.025t} = \frac{2000e^{0.025t} (\sin t - 40 \cos t + 1601)}{1601} + C$$

$$m = \frac{2000 (\sin t - 40 \cos t + 1601)}{1601} + m_0 \cdot e^{-0.025t} \quad \text{--- (vi)}$$

at $t = 0 \text{ min}$ and $m = 150 \text{ lb}$ of salt

$$150 = \frac{2000 (\sin 0 - 40 \cos 0 + 1601)}{1601} + m_0 \cdot 1$$

$$150 = 1950.03 + m_0$$

$$m_0 = -1800.03$$

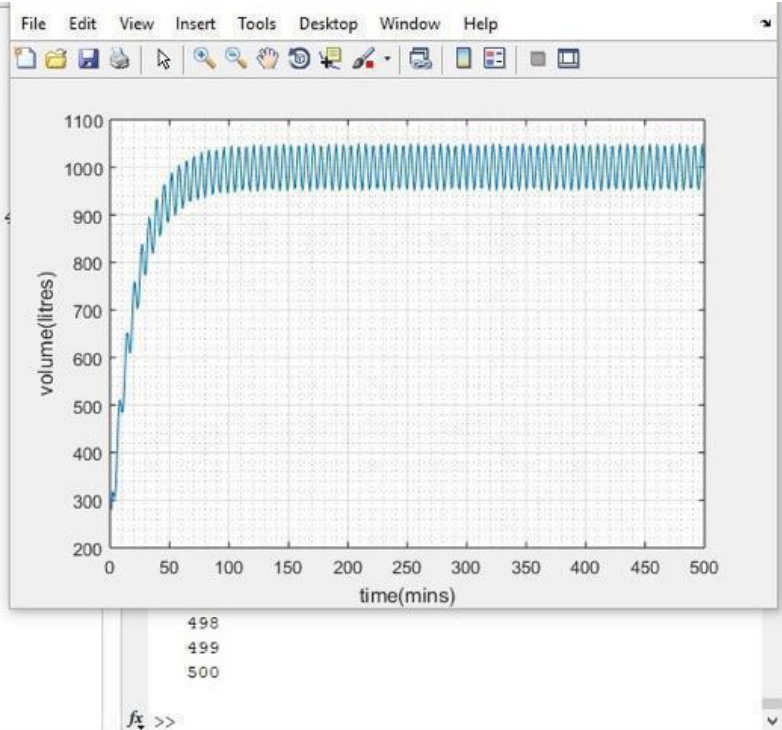

put m_0 in eqn (vi)

$$m = \frac{2000 (\sin t - 40 \cos t + 1601)}{1601} - \frac{1800.03}{e^{0.025t}}$$
