$$\textcircled{1} \quad y = \frac{t^3 - t^2}{2-2t+4}$$

$$\text{Let } u = t^3 - t^2 \quad v = 2-2t+4$$

Using the quotient rule

$$\frac{dy}{dx} = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2}$$

$$\frac{dy}{dx} = 8t^2 - 2t \quad \frac{du}{dt} = 3t^2 + 2t$$

$$\frac{dy}{dx} = \frac{v \frac{du}{dt} - u \frac{dv}{dt}}{v^2}$$

$$= \frac{2-2t+4(3t^2+2t) - t^3 + t^2(-2)}{(2-2t+4)^2}$$

$$= \frac{6t^2 - 4t - 6t^3 + 4t^2 + 10t^2 - 8t + 2t^3 - 2t^2}{(2-2t+4)^2}$$

$$= \frac{-4t^3 + 20t^2 - 12t}{(2-2t+4)^2}$$

$$= t \frac{(-t^2 + 5t - 3)}{(3-t)^2}$$

$$\therefore \frac{dy}{dt} = t \frac{(-t^2 + 5t - 3)}{(3-t)^2}$$

for a stationary point

$$\frac{dy}{dt} = 0$$

$$t \frac{(-t^2 + 5t - 3)}{(3-t)^2} = 0$$

$$t = \frac{5 - \sqrt{15}}{2} \approx 0.697$$

$$t=0$$

$$L = \frac{\sqrt{13} + 5}{2} \approx 4.303$$

$$\text{when } t = 0.697$$

$$y = \frac{(0.697)^3 - (0.697)^2}{2 - 2(0.697) + 4}$$

$$y = -0.03$$

$$(t = 0.697, y = -0.03)$$

~~short~~

$$\text{when } L = 0$$

$$y = \frac{(0)^3 - (0)^2}{2 - 2(0.697) + 4}$$

$$= y = 0$$

$$(t = 0, y = 0)$$

$$\text{when } L = 4.303$$

$$y = \frac{(4.303)^3 - (4.303)^2}{2 - 2(4.303) + 4}$$

$$y = 23.47$$

$$(L = 4.303, y = 23.47)$$

$$② 2y^2 - 5x^4 - 2 - 7y^3 = 0 \text{ find } \frac{dy}{dx}$$

$$4y \frac{dy}{dx} - 20x^3 - 21y^2 \frac{dy}{dx} = 0$$

$$4y \frac{dy}{dx} - 21y^2 \frac{dy}{dx} = 20x^3$$

$$\frac{dy}{dx} (4y - 21y^2) = 20x^3$$

$$\therefore \frac{dy}{dx} = \frac{20x^3}{4y - 21y^2}$$

(3)

$$4x^2 + 2xy^3 - 5y^2 = 0$$

$$8x + 2y^3 + 6xy^2 \frac{dy}{dx} - 10y \frac{d^2y}{dx^2} = 0$$

$$6y^2 \frac{dy}{dx} - 10y \frac{d^2y}{dx^2} = -8x - 2y^3$$

$$\frac{dy}{dx} (6xy^2 - 10y) = -8x - 2y^3$$

$$\therefore \frac{dy}{dx} = -\frac{8x + 2y^3}{6xy^2 - 10y}$$

⑥ $\frac{dy}{dx}$ at $x=1, y=2$

$$\frac{dy}{dx} = -\frac{8(1) + 2(2)^3}{6(1)(2)^2 - 10(2)}$$

$$\therefore \frac{dy}{dx} = -\frac{6}{-6} = 1$$
