Structured computer Programming

### Development Cycle;

#### 1. Planning;

Automation of the entire irrigation system; the software which will check the soil temperature , Determine moisture content of the soil ,Trigger an alarm when the water is insufficient, Create a password.

#### 2. Product design ;

The application will be scalable hence it will be able to be used on devices ranging from desktops to phones

It will be cross platformed to be able to run on Windows,Mac OS , Android etc

It will be cloud hosted

#### 3. Coding

#### 4. Implementation and Integration

Traditional and SPA behaviors supported.

5. Software and Testing;  
Easily tested with automated tests

6. Installation and Maintenance

### Software Features

The software function for the Temperature measurement will be Configuration , Charting , Alarm management , Data retrieval, Reporting .

For the alarm system , the alarm delivery methods include : Visual indicator, Audible alarm, Text message

The software will be able to time itself on the intervals which the automated water sprinkler will operate.

### HARD WARE features;

There will be the integration of several hardware components to perform tasks.

Beginning with the thermometer that will be used to measure the temperature of the soil,

The Barometer that will be used to measure the moisture

Sound system(Alarm system)

The display which will enable great user interface .

## Algorithm

Step 1 : Start

Step 2 : Read int T , M, t, W

Step 3 : Get values

Step 4 : Read Temperature==T

    If  $T > 30$

        Print Temperature high

    Else

Print Temperature normal

    Read Moisture ==M

    If  $M > 18\%$

        Print Moisture too high

    Else

        Print Moisture normal

Step 5: Read time==t

if Moisture  $< 10\%$

    Start sprinkler system for  $t=15$  minutes

Step 6: Read weight of water in the tank==W

If  $W < 1\text{kg}$

    Print Water in the tank is too low

    Ring alarm

Step 7: Read code

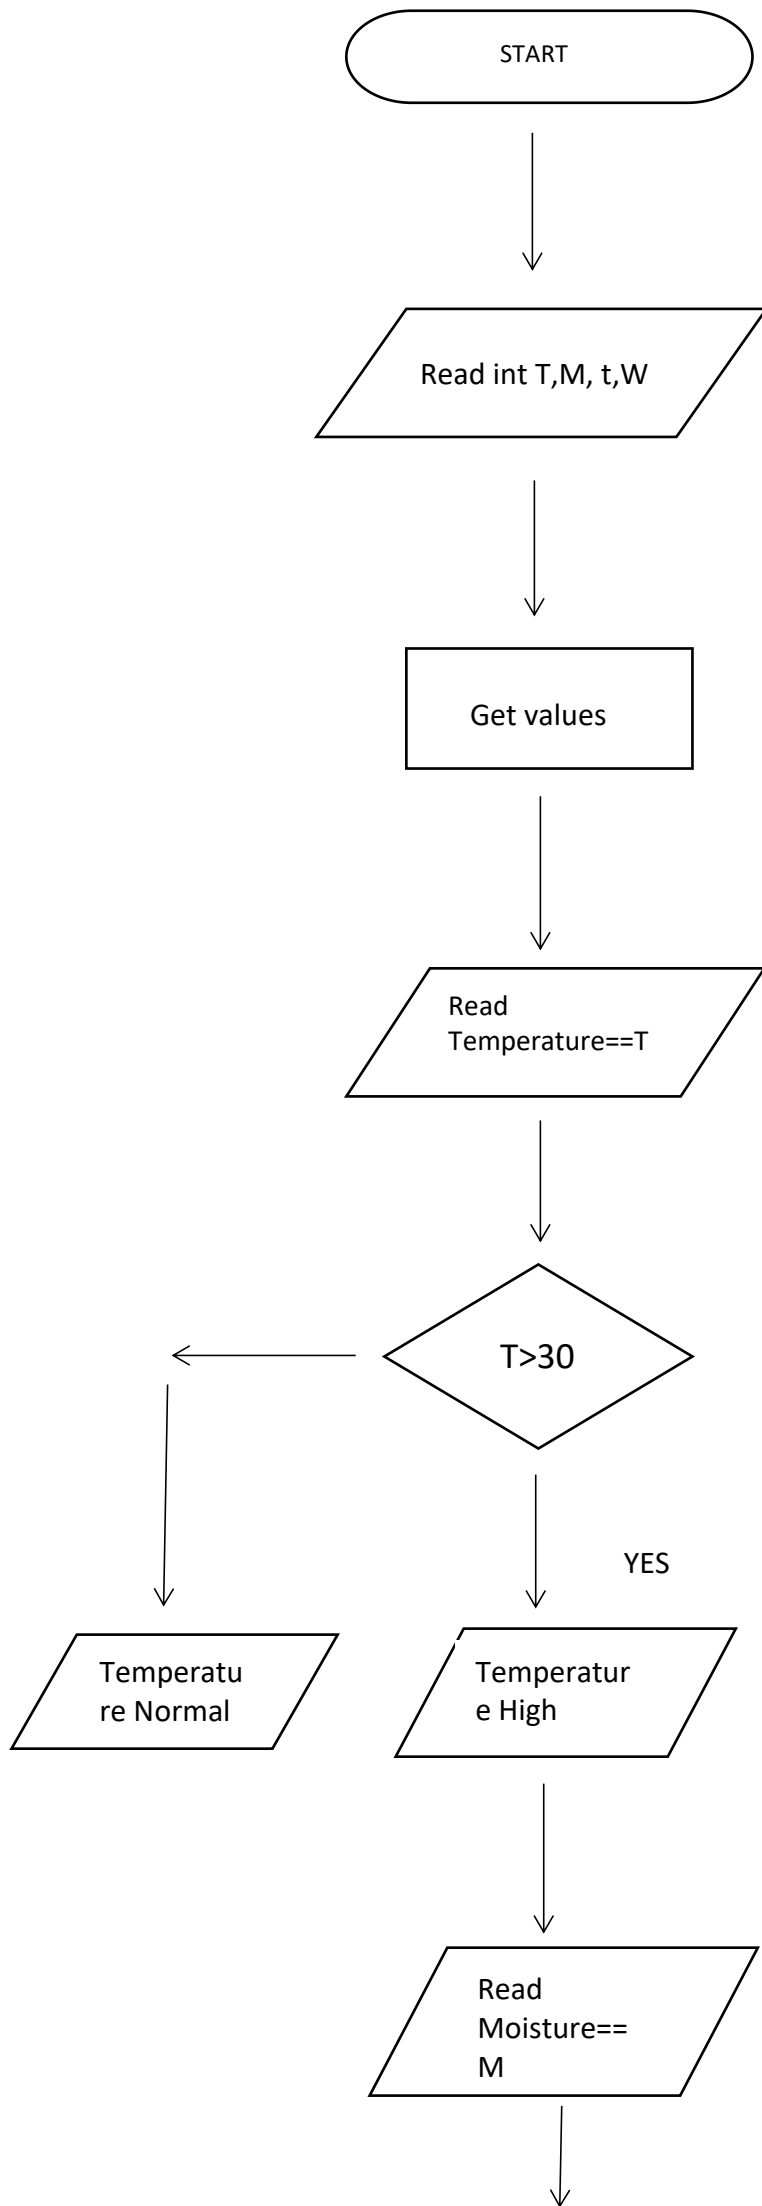

Step 8: if code ==MQSDE

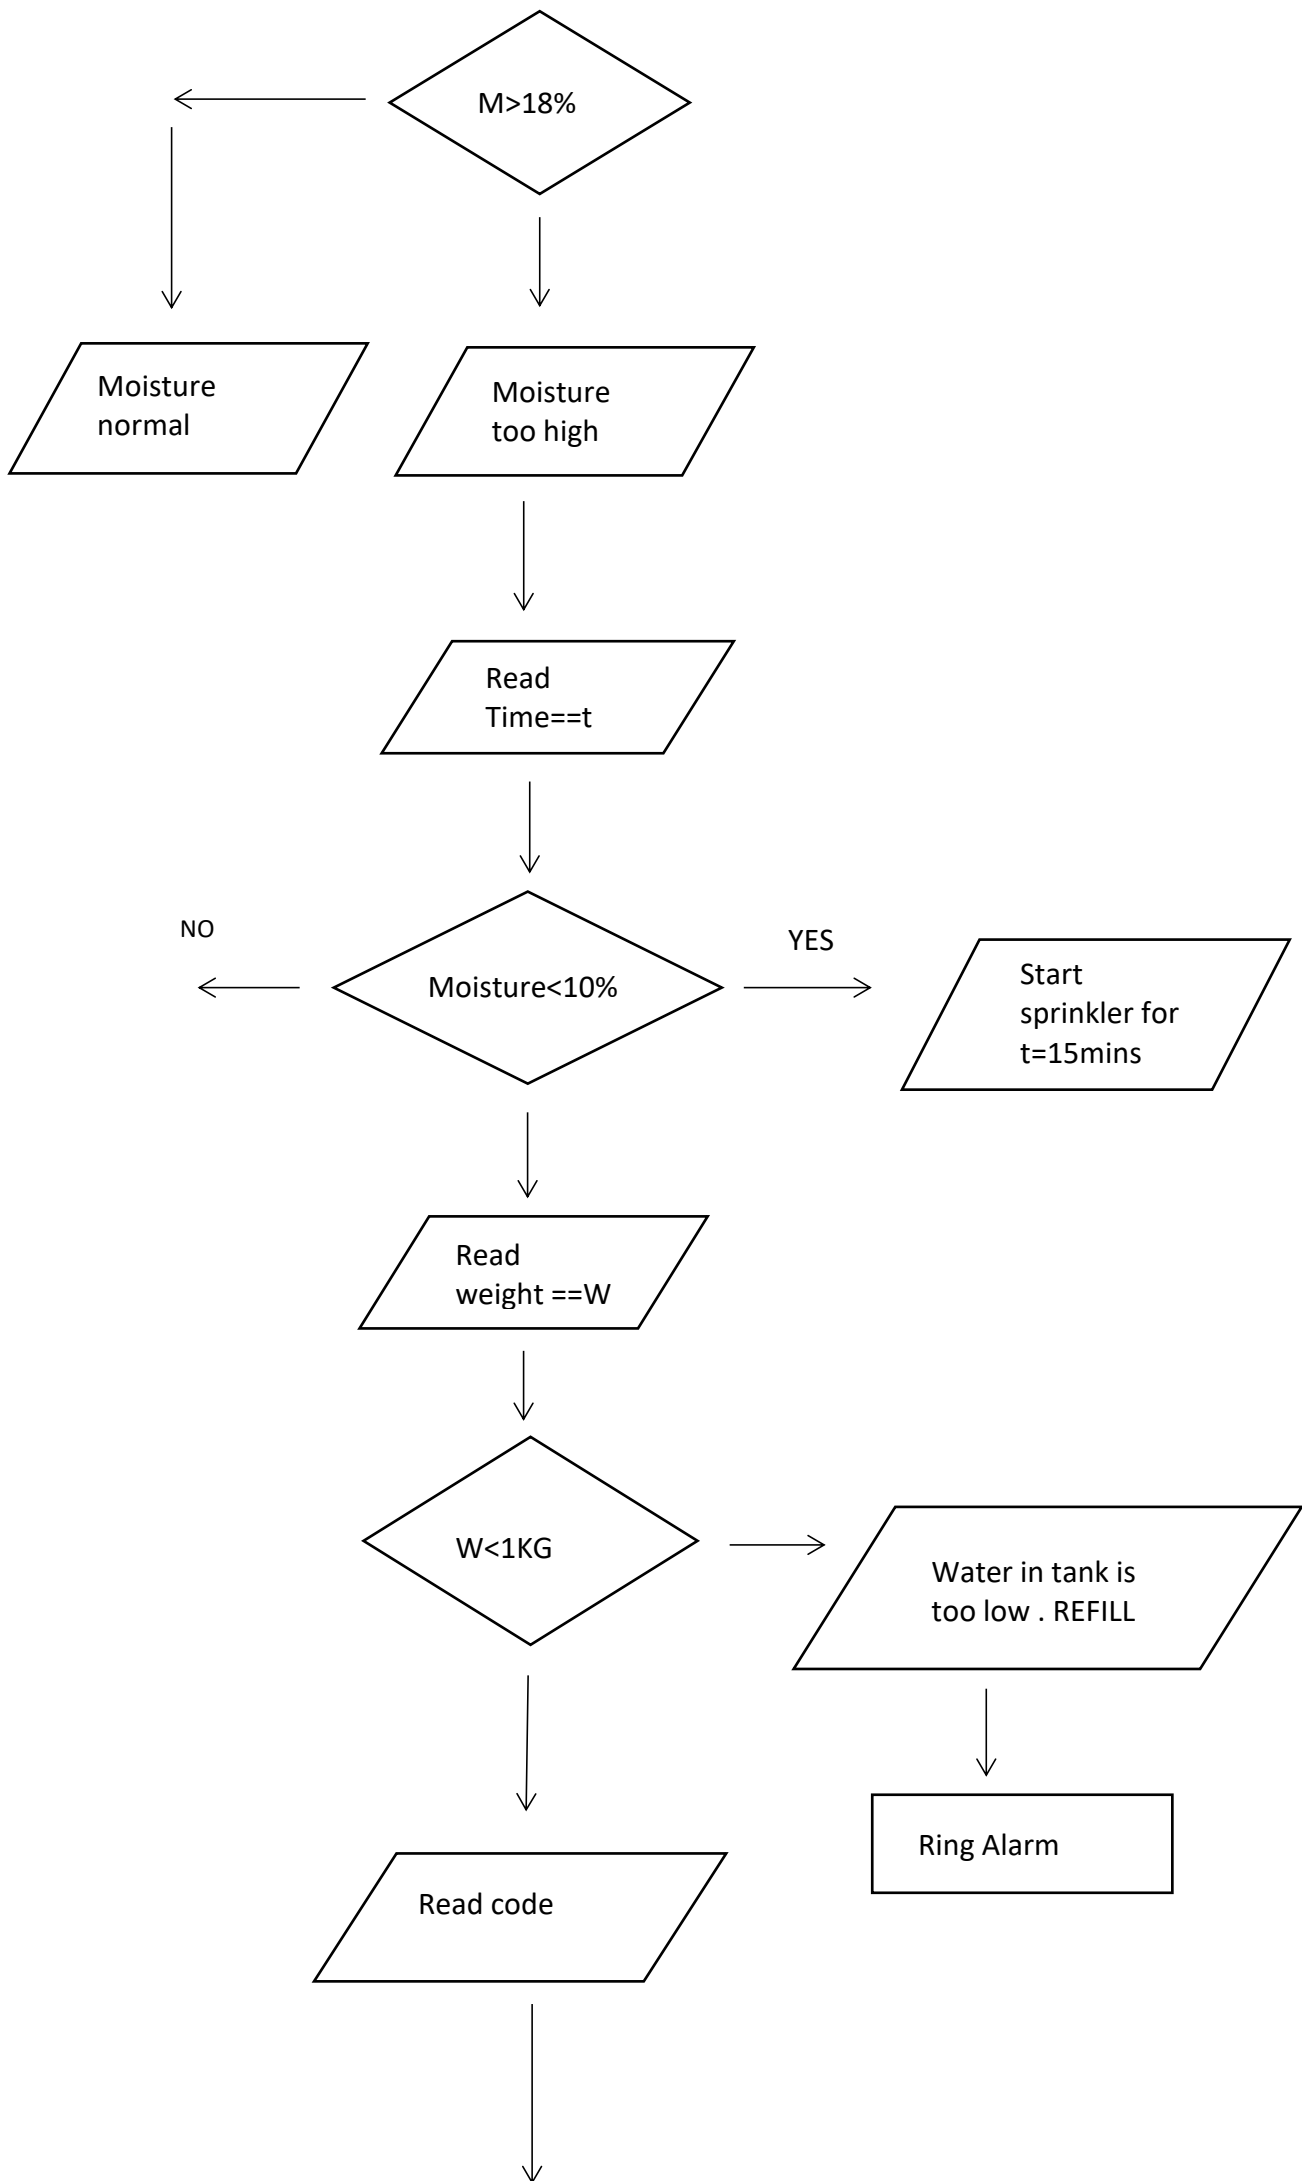

    Print Password correct

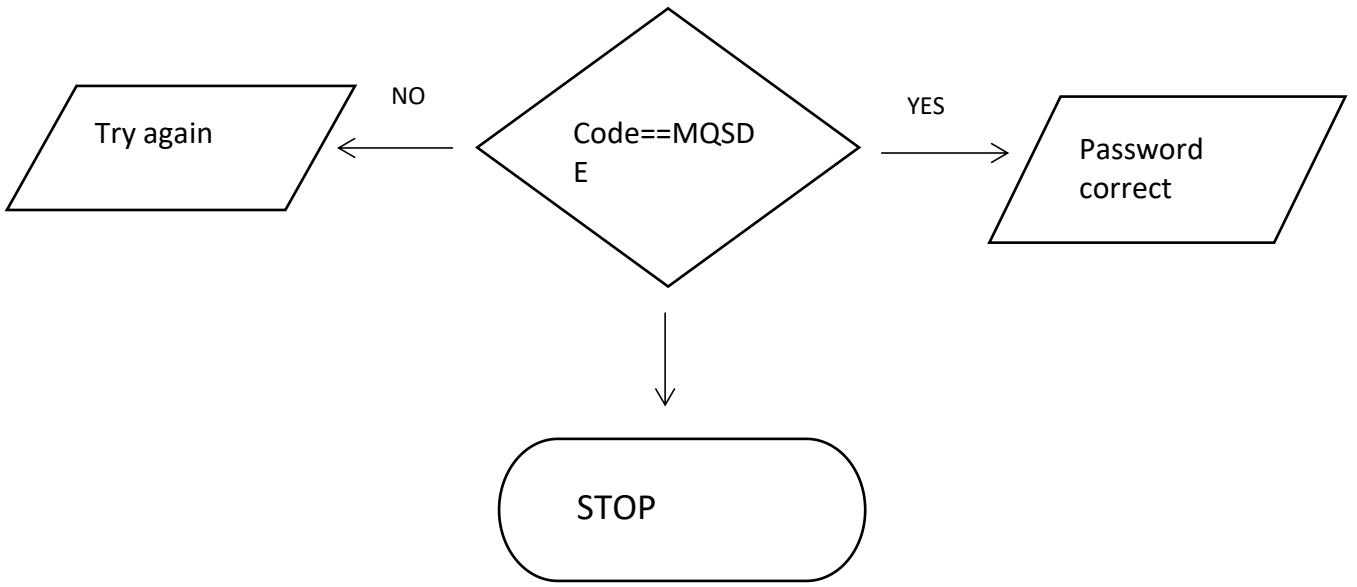

    Else

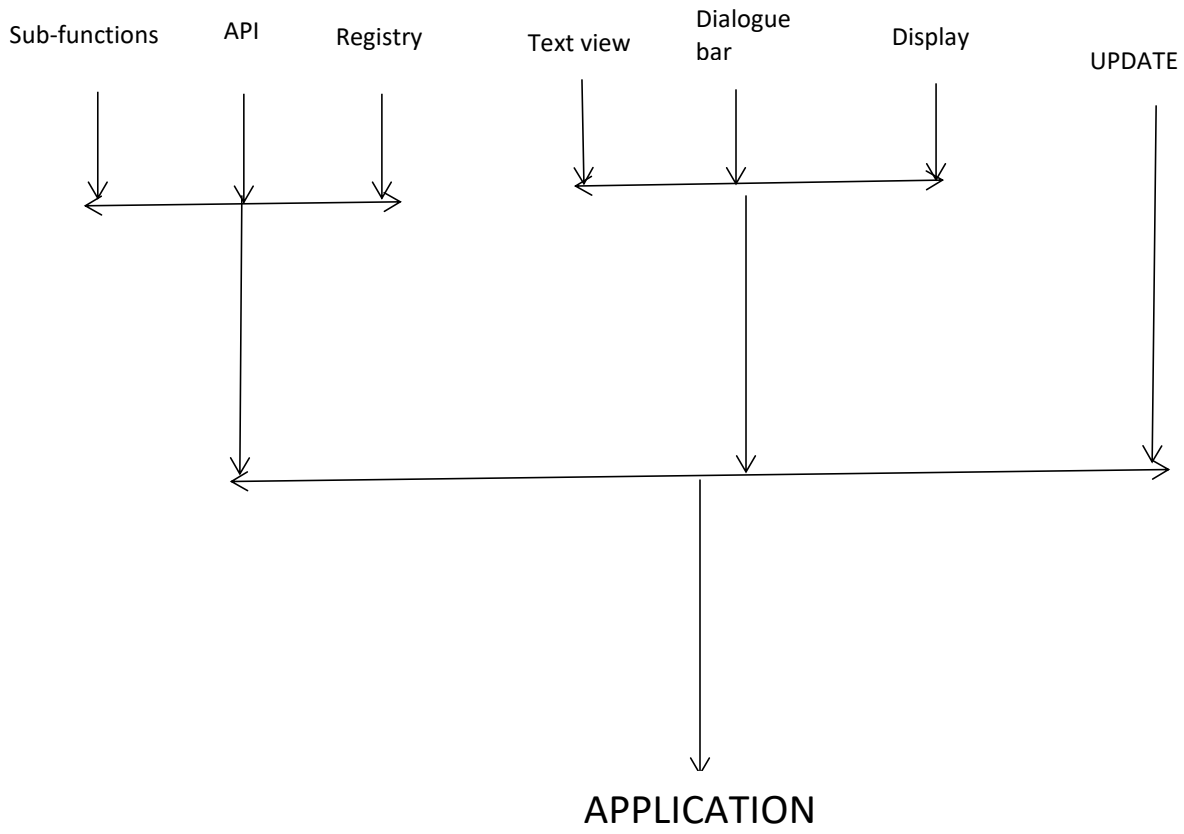

        Print Try again

Step 9: Stop

## BOTTOM UP APPROACH
