## **CHEMISTRY ASSIGNMENT**

Name: Udoh Belema Arit Dein

Assignment Title: Assignment on Carbxylic acids

Course Title: General Chemistry II

Course Code: CHM 102

Department: Computer Engineering

Matric No.: 19/ENG02/069

## 1. Give the IUPAC names of the following compounds

COMPOUNDS IUPAC NAME

HCOOH Methanoic Acid

HOOCCH<sub>2</sub>CH<sub>2</sub>COOH Pentan-1,5-dioic acid

CH<sub>3</sub>CH<sub>2</sub>COOH Butanoic acid

HO<sub>2</sub>C-CO<sub>2</sub>H Ethanedioic acid

CH<sub>3</sub>(CH<sub>2</sub>)<sub>4</sub>COOH Hexanoic acid

CH<sub>3</sub>CH=CHCH<sub>2</sub>CH<sub>2</sub>COOH Hex-4-eneoic acid

- 2. Discuss briefly the physical properties of carboxylic acids under the following headings
  - i. Physical appearance
    - All simple aliphatic carboxylic acids up to C<sub>10</sub> are liquids at room temperature.
       Most other carboxylic acids are solid at room temperature although anhydrous carboxylic acid (acetic acid) also known as glacial ethanoic acid freezes to an ice-like solid below the room temperature.

## ii. Boiling Point

 Boiling point increases with increasing relative molecular mass. Aromatic carboxylic acids are crystalline solids and have higher melting points than their aliphatic counterparts of comparable relative molecular mass.

## iii. Solubility

- Lower molecular mass carboxylic acids with up to four carbon atoms in their
  molecules are soluble in water; this largely due to their ability to form
  hydrogen bonds with water molecules. The water solubility of the acids
  decreases as the relative molecular mass increases because the structure
  becomes relatively more hydrocarbon in nature and hence covalent. All
  carboxylic acids are soluble in organic solvents
- 3. Write two industrial preparations of carboxylic acids
  - a. From Carbon(II) oxide
  - b. From petroleum
- 4. With equations and brief explanation discuss the synthetic preparation of carboxylic acid
- a. Oxidation of primary alcohols and aldehydes

Oxidation of primary alcohols and aldehydes can be used to prepare carboxylic acids using the usual oxidizing agents (i.e  $K_2Cr_2O_7$  or  $KMnO_4$ ) in acidic solution

RCH<sub>2</sub>OH [O], excess acid/KMnO<sub>4</sub> RCHO [O] RCOOH

b. Carbonation of Grignard reagent

Aliphatic carboxylic acids are obtained by bubbling carbon (IV) oxide into the Grignard reagent and then hydrolyzed with dilute acid

R may be 1°, 2°, 3° aliphatic alkyl or aryl radical

In the preparation of benzoic acid, the reagent is added to solid carbon (IV) oxide (dry ice) which also serves as coolant to the reaction mixture

$$C_6H_5MgBr + CO_2 \longrightarrow C_6H_5COOMgBr \longrightarrow H_2O/H^+ \rightarrow C_6H_5COOH +$$
 MgBrOH

c. Hydrolysis of nitriles (cyanides) or esters

$$RCN + 2H_2O \longrightarrow RCOOH + NH_4^+$$

(R=alkyl or aryl radical)

RCOOR' 
$$\frac{\text{H}_2\text{O/H}^+ \text{ reflux}}{\text{RCOOH} + \text{R'OH}}$$

$$C_6H_5CH_2CN + 2H_2O \longrightarrow C_6H_5CH_2COOH + NH_4^+$$

$$CH_3CH_2COOCH_3 \longrightarrow H_2O/H^+ reflux \rightarrow CH_3CH_2COOH + CH_3OH$$

5. With chemical equation only, outline the reduction, decarboxylation and esterification of carboxylic acid

$$CH_3CH_2COONa + NaOH$$
  $\longrightarrow$   $CH_3CH_2CH_3 + Na_2CO_3$ 

Kolbe synthesis

$$(anode) + 2NaOH + H_{2(cathode)}$$

In the presence of strong acid catalyst, carboxylic acids react with alcohols to form

esters

$$CH_3CH_2COOH + CH_3CH_2CH_2OH$$
  $\leftarrow$   $H^+$   $\rightarrow$   $CH_3CH_2CH_2COO CH_2CH_2CH_3 +  $H_2O$ .$
