Elec/ elect

Contracts are awarded to engineering companies ie rehabilitation of an express way. Such contractors must have

- Ecologist so as to preserve the land where the engineering operation is being done
- an engineering supervisor,
- an economist.

The engineering supervisor should ensure that the job done by these worker meet all engineering requirements and specification. This must be done without bias.

The economist here must work hand in hand with both the human resource manager and the supervisor as he controls their funding. However, this power shouldn't be abused. He must correlate with the supervisor to know how the material chosen, the engineering approach taken and a few other factors affect the funding.

The ecologist literally plays a behind the scenes role and only steps in when any step taken into the project seeks to harm the environment.

With all these put into place, the office of the presidency should give their best shot at ensuring no corrupted individuals are a part of the project. This enables smooth flow of funds from the presidency to the mere workers and this boosts communication.
