5

Name: Jeremiah Joan

Matric no: 18/ mhs02/097

Course code: phs 212

Question

Write short notes in the characteristics (and components) of urine

Physical **characteristics** that can be applied to **urine** include color, turbidity (transparency), smell (odor), pH (acidity – alkalinity) and density

 Color: Typically yellowamber, but varies
according to recent diet
and the concentration of
the urine. Drinking more
water generally tends to
reduce the concentration
of urine, and therefore
causes it to have a lighter

- color. Dark urine may indicate dehydration. Red urine indicates red blood cells within the urine, a sign of kidney damage and disease.
- Smell: The smell of urine may provide health information. For example, urine of diabetics may have a sweet or fruity odor due to the presence of ketones (organic molecules of a particular structure) or glucose.
 Generally fresh urine has a mild smell but aged urine has a stronger odor similar to that of ammonia.
 - The pH of normal urine is generally in the range 4.6 – 8, with a typical average being around 6.0. Much of the variation occurs due to diet. For example, high protein diets result in more

- acidic urine, but vegetarian diets generally result in more alkaline urine (both within the typical range of
- 4.6 8).
 Density: Density is also known as "specific gravity." This is the ratio of the weight of a volume of a substance compared with the weight of the same volume of distilled water. The density of normal urine ranges from 0.001 to 0.035.
- Turbidity: The turbidity of the urine sample is gauged subjectively and reported as clear, slightly cloudy, cloudy, opaque or flocculent. Normally, fresh urine is either clear or very slightly cloudy. Excess turbidity results from the presence of suspended particles in the urine, the

be determined by the results of the microscopic urine sediment examination. Common causes of abnormal turbidity include: increased cells, urinary tract infections or obstructions.

cause of which can usually

Abnormalities in any of these of physical characteristics may indicate disease or metabolic imbalances. These problems may seem superficial or minor on their own, but can actually be the symptoms for more serious diseases, such as diabetes mellitus, or a damaged glomerulus.
