

Name: Opoola Temitope Susan

Matric No: 18/MHS02/164

Department: Nursing

Course code: PHS212

Date: Wednesday 24th , June, 2020

Write a short note on the characteristics (and components) of urine.

Urine, a typically sterile liquid by-product of the body, is secreted by the kidneys through a process called urination and excreted through the urethra. Urine is often used as a diagnostic feature for many disease conditions. These may be based on either physical or chemical components, that may give insight to processes within the body, often through urinalysis, a common clinical analysis of urine.

Physical Characteristics

Physical characteristics that can be applied to urine include color, turbidity (transparency), smell (odor), pH (acidity – alkalinity) and density. Many of these characteristics are notable and identifiable by vision alone, but some require laboratory testing.

- **Color:** Typically yellow-amber, but varies according to recent diet and the concentration of the urine. Drinking more water generally tends to reduce the concentration of urine, and therefore causes it to have a lighter color. Dark urine may indicate dehydration. Red urine indicates red blood cells within the urine, a sign of kidney damage and disease.
- **Smell:** The smell of urine may provide health information. For example, urine of diabetics may have a sweet or fruity odor due to the presence of ketones (organic molecules of a particular structure) or glucose. Generally fresh urine has a mild smell but aged urine has a stronger odor similar to that of ammonia.
- **The pH of normal urine is generally in the range 4.6 – 8, with a typical average being around 6.0.** Much of the variation occurs due to diet. For example, high protein diets result in more acidic urine, but vegetarian diets generally result in more alkaline urine (both within the typical range of 4.6 – 8).
- **Density:** Density is also known as “specific gravity.” This is the ratio of the weight of a volume of a substance compared with the weight of the same volume of distilled water. The density of normal urine ranges from 0.001 to 0.035.

Turbidity: The turbidity of the urine sample is gauged subjectively and reported as clear, slightly cloudy, cloudy, opaque or flocculent. Excess turbidity results from the presence of suspended particles in the urine. Common causes of abnormal turbidity include: increased cells, urinary tract infections or obstructions.

Components of urine

- Electrolytes such as sodium, potassium, calcium, magnesium and chloride.

- Nitrogenous chemicals such as urea and creatinine.
- Vitamins.
- Hormones.
- Organic acids such as uric acid.
- Other organic compounds.
